Introduction

Index number for manufacturing (includes indices of input and output and IIP) is one of the most important statistical measures which helps to know inflation of goods produced locally, at this juncture, base year 2012 has updated by index numbers department instead of 2007 as it considered a modern year and this will help to keep a close eyes on industrial products size and know its trends. It is used to estimate national account indicators (Gross domestic product (GDP), (GDP) per capita government and private expenditure, gross fixed capital formation and exports) with fixed prices as well as other uses.

In view of this and within the tireless efforts of CSO in sorted out these indices for different economic activities, index numbers department has prepared this report on index number of products quantities and inputs and outputs prices in manufacturing for large industrial establishments for quarter 2018 with base year 2012.

Methodology

1. Base year

Input and output prices in 2012 have been used as a base year to calculate the index numbers of output and input for manufacturing industry.

As well as products quantities in 2012 have been also used to calculate index number for manufacturing industry.

2. Commodity basket

Products sample of inputs and outputs price indices has been selected by depending on the relative importance of industrial products where all products mentioned in the quarterly index number questionnaire of manufacturing industries were chosen by excluding products that are of a relative importance near to zero, where outputs sample size was (263) industrial product of (333) industrial product distributed on (18) divisions by ISIC4 after excluding one division for their low relative importance . The total value of these chosen products was (98.9%) of the total value of production in manufacturing industries sector.

As for inputs sample size, it was (342) industrial input (production staff) distributed on (18) divisions of ISIC4, the total value of these selected inputs was (86.6%) of all production staff in manufacturing industries total value.

Survey included all large industrial establishments which amounted to (600) establishments, about (76) public establishments & (524) industrial establishments in private and mixed sectors.

3. Weights

Input and output prices

Production value in manufacturing industries by divisions (second distribution for industry) that had been taken from industrial statistics directorate for 2012 was adapted to account the relative importance of a division (industry weight) as set forth below:

$$\text{relative importance for division (industry weight)} = \frac{\text{production value for division}}{\text{total of production value in manufacturing industry}} \times 100 \dots\dots(1)$$

These weights are used to calculate general index number of inputs and outputs prices, while weights of selected industrial products (or inputs) within each division was calculated according to the relative importance of production value (or using) of product (product or industrial input) to the total production value (or using) of the division that product is related to multiplied by the relative importance of division production (industry weight) as set forth below:

$$\text{Industrial product weight} = \frac{\text{value of product}}{\text{total of division production value}} \times \text{industry weight} \dots\dots\dots (2)$$

$$\text{Industrial inputs weight} = \frac{\text{input value}}{\text{total of division production value}} \times \text{industry weight} \dots\dots\dots (3)$$

These weights are used in calculating inputs and outputs price indices of manufacturing industry divisions.

– Product quantities

Production value in manufacturing industries by divisions (second distribution for industry) that had been taken from industrial statistics directorate for 2012 was adapted to account the relative importance of a division (industry weight) as set forth below:

$$\text{relative importance for division (industry weight)} = \frac{\text{production value for division}}{\text{total of production value in manufacturing industry}} \times 100 \dots\dots\dots (4)$$

These weights are used to calculate general index number of industrial production, production value in each of food-stuff industry, beverages, refined petroleum products industry and other non-metallic mineral products industry was at a rate of (74.9%) of the total production value in manufacturing industries sector.

While weights selected of industrial products industry within each division were calculated by the relative importance base of production value of the product to the total division production that product belongs to multiplied by the relative importance of division production (industry weight) as set forth below:

$$\text{Industrial product weight} = \frac{\text{value of product}}{\text{total of division production value}} \times \text{industry weight} \dots\dots\dots (5)$$

These weights are used in calculating industrial production indices by manufacturing industries divisions.

4. Calculation formula

Laspeyres, prices formula which depends on weights of the base year 2012 has been used in calculating index number in manufacturing industries, as set forth below:

$$I_P = \frac{\sum \frac{P_1}{P_0} \times W}{\sum W} \times 100 \dots\dots\dots (6)$$

Where:

IP= index number of industrial production prices

P1= price average in current quarter

P0= price average in 2012

W= weight

Index numbers prices are calculated by divisions then these numbers will be adapted with weights in calculating general index number in the very quarter of the year.

Laspeyres, formula which depends 2012 base year weights has been used in calculating industrial production in manufacturing industries, as set forth below:

$$I_Q = \frac{\sum \frac{Q_1}{Q_0} \times W}{\sum W} \times 100 \dots \dots \dots (7)$$

Where:

IQ= index number for industrial production

Q1= production in current year

Q0= production in 2012

W= weight

Industrial production index numbers are being calculated by divisions then these numbers will be adapted with weights in calculating general index number in the very quarter.

5. Source of Data

Calculating index numbers prices of inputs and outputs prices in the large industrial establishments had been depended on data in the quarterly questionnaire of indices by manufacturing industries in the large industrial establishments which is provided by Industrial Statistics Directorate, these data represent (12) governorates excluding Industrial realm in Kurdistan region also data do not include Nineveh, Salah al-Deen, Al-Anbar and Kirkuk due to the deterioration in security situation.

6. Product classification

International Standardized Industrial Classification ISIC4 was adapted to classify manufacturing industry activity to (18) divisions (2-digits) and after excluding one division (tobacco products), because of their low relative importance that included industrial products until (7-digits).

Table below shows divisions and their weights, number of products, inputs items and number of large industrial establishments

Divisions, weights, and number of industrial products items and inputs included and number of the large industrial establishments
Table. (1)

code	Division	Weight	number of establishments	number of input Items	number of output items
10	Food-Stuff and	7.565	132	60	34
11	Beverages	6.393	13	5	2
13	Textiles	0.624	6	15	18
14	Clothes, fur preparing and coloring	0.209	1	10	15
15	Tanning and preparing leather, making baggage ,hand bags, saddles, reins and shoes	0.111	1	5	5
17	Paper and paper products	0.079	1	6	3
18	Printing, publishing and copying recorded News media	0.322	9	15	16
19	Refined petroleum products	42.161	27	16	14
20	Chemical products	6.050	10	76	43
22	Rubber and Plastic products	0.642	9	11	12
23	Nonmetallic minerals products (Other)	23.56	372	39	36
25	Compound minerals products excluding machinery and equipments	2.092	2	37	13
26	Radio, TV and communications equipments	4.983	1	1	19
27	Apparatus and appliances Non - classified elsewhere	0.070	9	11	5
28	Electric equipments & devices Non - classified elsewhere	1.514	2	20	13
29	Engine vehicles and trailer & half trailer vehicles	3.512	2	3	5
30	Other transportation equipments	0.052	1	2	2
31	Furniture and manufactured products Non- classified elsewhere	0.061	2	10	8
General Index Number		100	600	342	263

7. Contribution rates

It represents the contribution of each division in manufacturing industries in annual and quarterly change rate.

Contribution rates in quarterly (annual) change rate of the general index number are calculated as in the equation below:

$$CR_i = \frac{IQ_{i1} - IQ_{i0}}{IQ_0} \times W_i \quad (i = 1, 2 \dots 18)$$

CR_i: contribution rate of division *i* in the quarterly change rate (annual) of the general index number

IQ_{i1}: index number of division *i* in the current quarter (year)

IQ_{i0}: general index number in the previous quarter (year)

IQ₀: General index number in the previous quarter (year)

W_i: relative importance for division (weight)

While contribution rate in quarterly (annual) change rate of the general index number (percentage) is being calculated as in the below equation:

$$CR_i (\%) = \frac{CR_i}{CR} \times 100 \quad (i = 1, 2 \dots 18)$$

CR_i: contribution rate of division *i* in quarterly (annual) change rate of the general index number

CR: quarterly (annual) change rate for general index number

Price Index Numbers Trends in Manufacturing Industries

Outputs price indices in manufacturing industries for 2018 has amounted to (169.4%) by 2012 as a base year registering an increase of (0.9%) as compared with 2017 which reaches to (167.9%) as a result of the increase in index numbers for each of food - stuff , beverages, refined oil products, chemical products and especially other non-minerals products at the rates of (0.8%), (0.8%) , (1.0%) , (0.9%) and (0.9%) respectively as these industries are of high weights (7.565%), (6.393%), (42.161%), (6.050%), (23.560%) respectively , in addition to index numbers increase in all other divisions despite their low relative importance as in table (2) .

* Also in table number (3) the highest contribution rate in the annual change rate of outputs general index number was (52.0%) in oil refined products then comes non-minerals products at a rate of (22.5%) then food-stuff and division at a rate of (7.8%) and finally Beverages and division at a rate of (6.6%) while contribution rates for all other divisions are less.

for inputs prices in manufacturing industries, index number approached to (167.2%) for 2018 with 2012 as a base year, registering an increase of (0.7%) as compared with 2017 which was at a rate of (166.0%) as a result of index numbers increase at each of food - stuff , beverages, refined oil products, chemical products and especially other non-minerals products at the rates of (0.9%), (0.6%), (0.8%) , (0.9%) , (0.9%) respectively as these products are of high weights in addition to the increase in index numbers prices in all other divisions as compared with 2017 as in table (4) .

* In table number (5) the highest contribution rate in the annual change rate of inputs price indices in oil refined products at a rate of (46.4%) then non-minerals products at a rate of (25.9%) then food-stuff at a rate of (8.3%) and finally Chemical products division at a rate of (6.1%) while contribution rates for all other divisions are less.

Index Numbers Trends

* In table number (6) , the industrial production general index number of 2018 was (162.6%) with 2012 as a base year increasing at a rate of (0.8%) as compared with 2017 index number which amounted to (161.3%) , the increase is basically due to indices increase for each of food - stuff , beverages, refined petroleum products division, chemical products and other nonmetallic minerals products at the rates of (0.8%), (0.5%), (1.0%), (0.9%) and (1.1%) respectively as they are of a high relative importance which amounted to (7.565%), (6.393%), (42.161%), (6.050) , (23.560) respectively , in addition to index numbers increase in all other divisions and in fluctuated rates despite their low relative importance where Furniture and manufactured products Non- classified elsewhere division registered an increase of (0.9%) while both Clothes, fur preparing and coloring division an increase of (0.7%) All other divisions registered less increase rate.

In table number (7), refined petroleum products division registered the highest contribution rate in the annual change rate of the general index number which was (47.8%) then comes the nonmetallic minerals products division at a contribution rate of (28.3%) then Beverages and beverages division at a rate of (6.7%) and finally food-stuff division at a rate of (5.9%) and contribution rates were less than that in all other divisions.

Output Price Indices by Manufacturing Industries Divisions of 2018 and the Annual and Change Rates
 Table. (2) (100=2012)

code	Division	Weight	index number Year 2017	index number Year 2018	Annual change Rate %
10	Food-Stuff	7.565	181.5	183.0	0.8
11	Beverages	6.393	180.8	182.3	0.8
