

Section 3: Income indicators

Distribution of households and individuals by household income groups

All households were assigned to 18 income groups based upon monthly household income, ranging from less than 45,000 ID per month to more than 1,800,000 ID per month. The numbers and percentages of households and individuals living within those households were tabulated by income groups (Table 3.1).

The survey results indicated that 20.0% of total households, 18.4% of urban households and 23.1% of rural households had incomes of less than 190,000 ID per month.

Just over half of all households (50.5%), including 48.1% of urban households and 55.6% of rural households, had incomes of less than 330,000 ID per month.

Around 76.3% of all households, including 74.2 % of urban households and 80.7% of rural households, had incomes of less than 550,000 ID per month.

Only 3.9% of all households, including 4.0% of urban households and 3.7% of rural households had incomes of more than 1,100,000 ID per month.

Distribution of households and individuals by per-capita household income groups

All households were assigned to 18 income groups based upon average monthly per-capita household income, ranging from less than 10,000 ID per month to more than 300,000 ID per month. The numbers and percentages of households and individuals living within those households were tabulated by per-capita household income groups (Table 3.2).

The survey results indicated that in 20.6% all households, 16.2% of urban households and 30.0% of rural households, the average per capita income was less than 30,000 ID per month.

In almost half of all households (48.9%), including 43.5% of urban households and 60.5% of rural households, the average per capita income was less than 54,000 ID per month.

In 77.2% of all households, including 74.1 % of urban households and 83.9% of rural households, the average per capita income was less than 95,000 ID per month.

In only 4.1% of all households, including 4.9% of urban households and 2.4% of rural households was the average per-capita income more than 200,000 ID per month.

***Sources of household income
tabulated by household income
groups***

Average household income, analysed by source of income, has been tabulated by bands of household income, and average income across all households (Tables 3.3 to 3.5).

The monthly average household income was 449,290 ID overall, with an average of 474,218 ID in urban areas and 396,269 ID in rural regions.

The major source of household income was income from wages and salaries, which contributed 46.0% of total income overall, 45.7% in urban areas and 47.0% in rural areas. The next most significant source overall was income from non-agriculture self-employment, which contributed 17.0% of household income overall, 18.9% in urban areas but only 12.3% in rural areas. In rural areas, income from agricultural self-employment was more significant, at 20.7% of average total income. Not surprisingly, this category contributed only 2.9% of income in urban areas, and 7.9% of overall income.

The proportion of income derived from salary and wages increased steadily from 17.0% in the lowest household income group (less than 45,000 ID per month) to peak at 57.0% in the 550,000 to 650,000 ID per month group. At higher incomes the percentage trended slowly downward, with a sharp drop to 15.3% of total income for the highest income group (above 1,800,000 ID per month). A similar pattern was observed in urban areas, with the peak contribution from salary and wage income of 58.6% coming in the 650,000 to 750,000 ID per month income band, and the percentage in the highest income group falling to 10.2%. In rural areas, the upward trend continued further, with fluctuations, to reach a peak of 60.7% for the 1,400,000 to 1,800,000 ID per month band, while the contribution to the highest income group was more significant at 41.5%.

Income of employers contributed 9.2% of total income overall, with 3.9% from agricultural employers and 5.3% from other employers. In urban areas the employers' income share was 8.7%, with 2.0% from agriculture and 6.7% from other activities. In rural regions the employers' income share was 10.6%, with 8.8% from agriculture and 1.8% from other activities.

Income from social security benefits was the fourth highest source of income overall, contributing 8.3% on average, with 9.3% in urban areas and 5.9% in rural areas. Income from social security benefits was the major source of income for households in the lowest two income bands (up to 90,000 ID per month), contributing 40.8% of income overall, averaging 65.4% in urban areas but much less in rural regions. This category of income was the second most significant single source of income for households with incomes up to 190,000 ID per month overall.

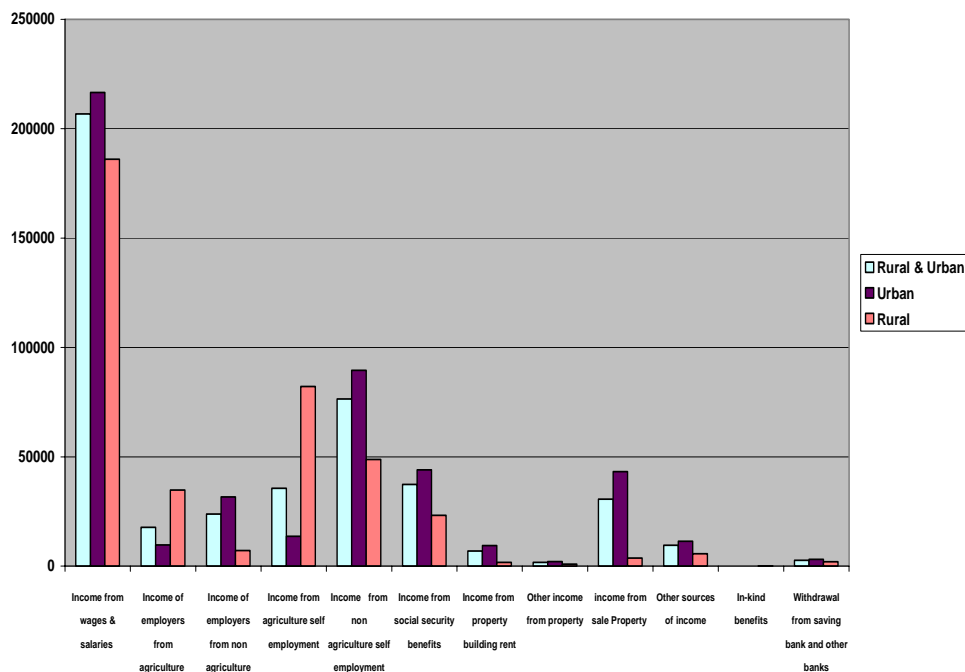

Income from property as rent, interest, and profit share contributed 1.9% of total income overall, with building rent contributing 1.5% and other income from property 0.4%. In urban areas income from property contributed 2.4% of income, and in rural areas just 0.6% of income.

Income from the sale of property contributed share 6.8% of total income overall, 9.1% in urban areas and 0.9% in rural areas. However, for the highest income group (above 1,800,000 ID per month), income from the sale of property contributed 51.3% of average household income.

Other sources of income (including transfer income from domestic or foreign sources and income from selling ration items) contributed 2.1% of total income, with 2.4% in urban areas and 1.4% in rural regions.

Income of households from the withdrawal of savings or receipt of loans from banks contributed 0.6% of total income overall, 0.6% in urban areas, 0.5% in rural areas.

Chart (3)
Average of monthly household income by household income groups and sources of income

Sources of per-capita household income tabulated by household income groups

Average per-capita household income, analysed by source of income, has been tabulated by bands of household income, and average income across all households (Tables 3.6 to 3.8).

The monthly average per-capita household income was 66,278 ID overall, with an average of 75,072 ID in urban areas and 51,086 ID in rural regions.

The percentage distribution of per-capita income for each income group by source of income was the same as that of household income, as in the preceding section.

However, since the average household size increase with income, the per-capita household incomes do not increase as rapidly with household income as do the household incomes themselves.

Sources of household income tabulated by per-capita household income groups

Average household income, analysed by source of income, has been tabulated by bands of per-capita household income, and average per-capita income across all households (Tables 3.9 to 3.11).

The monthly average household incomes in these tables are the same as reported above, in tables 3.3 to 3.5. However, the distribution of incomes by source follows a different pattern, as the per-capita income bands allocate households differently from the household income bands. As a consequence, the percentage composition of income in each band is somewhat different from the distributions in the preceding sets of tables. However, the differences are not so great as to require a repetition of much discussion. The same trends and patterns are observed.

Sources of per-capita household income tabulated by per-capita household income groups

Average per-capita household income, analysed by source of income, has been tabulated by bands of per-capita household income, and average per-capita income across all households (Tables 3.12 to 3.14).

The patterns here are the same as in the preceding set of tables, with the percentage distributions of income by source identical, although as in the comparison between the tables of household income by bands of per-capita (3.6 to 3.8) and by aggregate household income (3.3 to 3.5), the trends in absolute incomes in these tables (3.12 to 3.14) are less progressive than those in the preceding set of tables (3.9 to 3.11).

Sources of household income tabulated by household size groups

Average household income, analysed by source of income, has been tabulated by household size groups, and average income across all households (Tables 3.15 to 3.17).

Average total monthly household income increased with the size of households, from 1-2 person households at 250,738 ID up to 13-14 person households at 589,139 ID, but fell slightly to 573,305 for the largest households. Income in the main source categories followed a broadly similar pattern, with some variations, except that income from social security benefits was highest for 1-2 person households, and more or less constant over the remaining sizes of households. Income from property rent followed a similar pattern, but with more variation among household sizes.

The percentage of household income derived from salary and wages varied with the size of the household, being somewhat lower for 1-2 and person (42.2%) 3-4 person (41.6%) households than the average 46.4% (Table 3.17). It was highest for 5-6 person (49.0%) and 7-8 person (47.8%) households. Income from agricultural and non-agricultural self-employment was significantly lower for 1-2 and 3-4 person households, and higher for 11-12 person and larger households, than the average of 24.3%. Income from employers was lower for 1-2, 3-4 and 7-8 person households, and higher for other household sizes, than its average of 9.3%. Income from social security benefits was notably higher for 1-2 person (18.4%) and 3-4 person (10.0%) households than its average of 8.4%. Income from sale of property had peaks for 3-4 person (13.2%) and 9-10 person (15.4%) households, against its average of 6.9%.

The same kinds of variations for urban (Table 3.15) and rural (Table 3.16) households from the overall pattern were observed as were found in the variations in sources of income by bands of household income (as in Tables 3.3 to 3.5) described previously.

Sources of per-capita household income tabulated by household size groups

Average per-capita household income, analysed by source of income, has been tabulated by household size groups, and average income across all households (Tables 3.18 to 3.20).

Average total monthly per-capita income decreased with the size of households, from 134,831 ID for 1-2 person households down to 34,485 ID for 15 and more person households (Table 3.20). This trend was apparent in all main sources of income, with some fluctuations. Income from the sale of property showed a more random pattern of variation with household size. Similar patterns and trends were observed in the variation of total per-capita income and sources of income for urban and rural households (Tables 3.18 and 3.19).

The percentage composition of sources of income for each household size was exactly the same as in the previous set of tables (Tables 3.15 to 3.17).

Sources of household income tabulated by household income decile groups

Average household income, analysed by source of income, has been tabulated by decile groups of household income, and average income across all households (Tables 3.21 to 3.23).

Monthly average total household income increased (by definition) with the income decile group, from 86,243 ID for the lowest to 1,454,962 ID for the highest decile group overall (Table 3.21a). The median household income was 325,000 ID overall, ranging from 100,000 ID for the lowest decile to 850,000 ID for the highest decile group. The median income was below the mean income for all but the lowest decile group.

For urban households, the average total household income ranged from 89,023 ID for the lowest to 1,589,484 for the highest income decile group, while for rural households the corresponding range was from 81,101 ID to 1,171,547 ID (Tables 3.22a and 3.23a).

In this set of tables, a separate category was created, income from more than one source, thereby reducing the incomes reported in other categories. The percentage of household income reported in this category increases from 23.7% for the lowest decile group to 78.8% for the highest decile group. As a consequence, the percentages reported against all other income source categories are reduced, and it is difficult to draw meaningful conclusions about the observed trends within those source categories.

Comparison of survey results with results of previous surveys

The average household incomes and distribution of incomes by source in this 2005 Rapid Focussed Household Survey are compared to those measures from previous surveys conducted in 1988 and 2004.

This survey indicates that the average monthly household income had reached 449,290 ID in May 2005, while the Iraqi Living Conditions Survey published earlier this year indicated that average monthly household income was 185,833 ID in 2003 (on average) and 211,000 ID in (April and May) 2004, evidencing a growth in average household incomes of 141.8% since 2003 and 112.9% since 2004.

The monthly average per capita income had reached 75,072 ID in May 2005, while it was 30,500 ID in 2003 (on average) and 34,462 ID in (April and May) 2004, demonstrating a growth in average per-capita incomes of 146.1% compared to 2003 and 117.8% compared to 2004.

The share of wages and salaries income in total household income has increased significantly since the 1988 survey. For all households, the share has risen from 23.9% in 1988 to 46.0% in 2005, while for urban households the share has risen from 26.2% to 45.7%, and for rural households it has risen more sharply, from 15.8% to 47.0%.

The share of the combination of employers' income and income from self-employment has risen slightly overall, from 33.9% in 1988 to 34.1% in 2005, and in urban areas from 28.4% in 1988 to 30.5% in 2005. However, the share has fallen in rural areas, from 52.1% in 1988 to 43.6% in 2005.

The share of transfer income, including social income and other sources of income, has fallen from an overall figure of 23.0% in 1988 to 10.4% in 2005. In urban areas the share has decreased from 23.7% to 11.7%, and in rural areas from 20.8% to 7.3% over the same period.

The share of income from property has also declined, from an overall level of 18.6% in 1988 to 1.9% in 2005, with the urban share falling from 21.0% to 2.4%, and the rural share from 11.0% to 0.6%. The 1988 survey evidently included the imputed rent of owner-occupied dwellings as income, whereas the current survey did not.

Measurements of the inequality of incomes among households by the Gini coefficient and other indicators

Inequality of the distribution of incomes among households was calculated by comparing the income share of households in income bands, and by computing Gini coefficients for household incomes by decile.

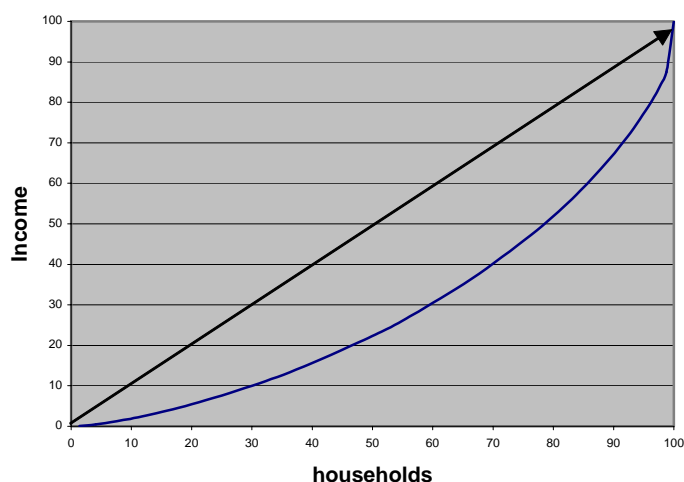

One indicator of inequality is the distribution of relative shares of income among higher income and lower income households. Using the average household monthly income by income bands (as in table 3.5), the lowest three income bands (up to 120,000 ID per month) comprised 7.6% of households and received just 1.3% of total household income, while the highest three income bands (above 1,100,000 ID per month) comprised 3.9% of households and received 21.5% of total household income.

For urban households (table 3.3) the lowest three income bands included 6.9% of households and received 1.1% of the total income, while the highest three income band households made up 3.9% of households and received 21.5% of the income.

Among rural households (table 3.5) the lowest three income bands included 9% of households and received 1.7% of the total income, while the highest three income band households made up 3.7% of households and received 15.9% of the income.

Gini coefficients were calculated as standard measures of inequality among household incomes using the decile banded household income data (as in tables 3.21 to 3.23). Gini coefficients can range between zero (for complete equality, with no differences between any household incomes) and unity (for complete inequality, where one household has all the income). Gini coefficients are related to the Lorenz curve, the plot of cumulative income share against the cumulative share of the number of households, when households are ranked in order of increasing income. For complete equality, the Lorenz curve is a steadily sloping line (at 45 degrees to the axes), while for complete inequality, the curve is a horizontal line along the axis. The ratio of the area between the Lorenz curve and the line of equality to the total area between the line of equality and the horizontal and right vertical axes is equal to the Gini coefficient.

Lorenz curve in Urban & Rural

The Gini coefficient for all households was 0.41, for urban households 0.42, and for rural households 0.39. Urban income inequality is greater than rural income inequality.

Using the decile household income groups, for all households, the lowest income group received 1.9% of the total income, while the highest group received 32.6% of the total income. The ratio of highest to lowest decile group (each with 10% of households) incomes was 17.16.

Comparison of inequality measures with results from previous surveys

Inequality measures, including Gini coefficients, from this survey are compared with those from previous surveys.

The value of Gini coefficient was higher compared with the values observed during the 1970's and 1980's. In one survey conducted in 1971/72, the Gini coefficient was 0.241 in the overall sample, 0.270 in urban areas, and 0.150 in rural areas. In 1976 the Gini coefficient reached 0.251 in the overall sample, 0.234 in urban areas and 0.180 in rural areas.

In another survey in 1972, the Gini coefficient was 0.220 in the combined areas, 0.206 in urban areas and 0.173 in rural areas. In the 1980's the inequality of income distribution started increasing compared to the 1970's. The Gini coefficient reached 0.363 in 1988 in the combined areas, 0.358 in urban areas and 0.367 in rural areas.
